

Abstract of the Disclosure

5 An improved punctum plug is more easily visualized when positioned within a
punctual canal of a recipient. The body of the plug features an outwardly exposed
surface when properly positioned, and a substance causing at least the outwardly exposed
10 surface to contrast with surrounding tissue, such that the use of the substance causes the
plug to be more easily visualized than if the substance were not present. The substance,
which may be disposed on the outwardly exposed surface or within the body of the plug,
may include a saturated coloration, or may be phosphorescent, fluorescent or otherwise
operative to reflect or re-radiate light to assist in visualization. For example, the
15 substance may include an organic or inorganic phosphor or fluorescent material,
reflective beads, quantum dots, a dye or pigment. Such reflection or re-radiation may
occur at the same or different wavelength(s) compared to the illumination wavelength(s),
whether or not either or both are within the visible part of the spectrum. If outside the
visible region, a detector may be employed according to the invention for detecting the
20 radiated light. A system for determining whether or not a punctum plug is positioned
within the punctal canal of a person's eye is also enclosed, including at least one optical
element permitting the eye to view itself, to be viewed by the other eye, or by a second
person.
